
Rule 54
1D Wolfram rule 54
T=800 -> p=4, s=0, defect=0.292.
last 240 rows of the run.
Finds a period-4 scaffold; the residual isolates clean domain walls and particle-like world-tubes.

Rule 110
1D Wolfram rule 110
T=800 -> p=4, s=-2, defect=0.340.
last 240 rows of the run.
Finds a drifting period-4 scaffold with shift -2; the residual keeps coherent but more tangled lanes.

S24/B11
2D Life-like S24/B11
T=800 -> p=2, s=(0, 0), defect=0.008.
late slice at t=701.
Finds a period-2 scaffold and leaves a sparse persistent defect population instead of featureless noise.

3D Rule 5858
3D totalistic S5-8/B5-8
T=80 -> p=1, s=(1, 1, -1), defect=0.290.
z-midplane at t=40.
At the stabilized horizon, NML selects only a trivial period-1 scaffold here, so the residual is essentially the observed 3D mass.
